

HAVE A FOCUSED CONVERSATION

A guide to talking with your doctor about **comprehensive biomarker testing in lung cancer**.

Every patient is unique, which is why it's important to be your own advocate and ask your doctor to look closer at your lung cancer. Testing for a wide range of biomarkers can help your doctor zero in on a treatment that might be appropriate for you. That's why it's important to identify the type of lung cancer you have before starting a treatment. Here are some ways you can get the conversation started with your doctor.

- Have we uncovered everything we can about my lung cancer?
- Does my lung cancer have any biomarkers?
- If yes, am I eligible for any of the targeted therapies for lung cancer?
- Organizations like the National Comprehensive Cancer Network® say we should talk to our doctor about comprehensive biomarker testing. What does this mean and are you doing this testing on my lung cancer?
- Is it appropriate to do a comprehensive biomarker test while waiting for other test results?

It's important to keep learning about how comprehensive biomarker testing can complete your diagnosis. Visit [LookCloserAtLungCancer.com](https://www.lookcloseratlungcancer.com)

Take it with you. Print this page or snap a photo and take it to your next doctor's appointment.
